NEKTON FEEDING TUBE

Specially designed and constructed with regard to the feeding habits of hummingbirds, sunbirds, bananaquits and butterflies.

Made of special-purpose brown plexiglass impervious to ultra-violet rays to protect the nectar solution, NEKTON nectar feeders are specially designed to ensure a bird reaches the very last drop. The bottom of the tube slopes towards the opening and the inside joints are curved so that the bird's tongue can travel smoothly up the sides of the tube.

The feeder will hold up to 40 ml, big enough to take the daily ration for all sizes of hummers. A measuring scale enables exact dosing for individual birds.
