

Birds

NEKTAR-PLUS

A complete diet for humming birds, sun birds, honey creepers, bananaquits, small lorikeets and other nectar-feeding species such as butterflies.

The composition of NEKTON-Nektar-Plus is oriented towards individual components of the hummingbirds' high requirements for nutrients and substances, where at the same time, NEKTON-Nektar-Plus has also become an excellent food mixture for sensitive sunbirds. The carbohydrates' composition reproduces flower nectar - which is the preferred source of nourishment for hummingbirds and sunbirds - and thus supplies these animals' metabolism with energy. Supplemented by vitamins, proteins, fats, major and trace elements, a balanced mixture emerges which contains all essential elements for these birds. We recommend the NEKTON feeding tube for feeding, which has been specially developed for NEKTON-Nektar-Plus. This ensures an extended shelf life of the important food components. The filling quantity of 40 ml is sufficient even to provide larger species with a single feeding per day. Under no circumstances should open feeding bowls be used, as this makes contaminations of these animals' feathers unavoidable.
