NEKTON-Q

A multi-vitamins supplement for birds with a high vitamin K contents for birds under temporarily treatment with antibiotics during serious illness or in quarantine. Also ideal for fig parrots which require more vitamin K than other species.

NEKTON-Q supports the bird's body in coping with the effects of medication treatments, particularly injection treatments with antibiotics and sulfonamides and above all, hemorrhaging in the organs and tissues of the animal's body. NEKTON-Q encourages defense against infections by increasing antibody production, positively affecting the epithelial tissue, stabilizing circulation and improving blood clotting (particularly important with antibiotic treatments).

As an “epithelial protection vitamin”, vitamin A improves the functionality and infection defense of diverse cell structures as a result of increased antibody production. Vitamin E provides protection for the cell membranes, an orderly energy metabolism and an intact immune system. Vitamin K for maintaining the functionality of the blood clotting system. Other vitamins, trace elements and amino acids, which are very important for intermediate metabolic cycle, are included in a balanced proportion.

NEKTON-Q should only be used as needed in cases of illness. No other vitamin compound should be administered whilst using this. NEKTON-Q is soluble in water and is administered daily in drinking water, or mixed in with soft feed.
